Interactive comment on “Short term variability of dissolved lipid classes during summer to autumn transition in the Ligurian sea (NW Mediterranean)” by M. Goutx et al.

C. Parrish (Referee)
cparrish@mun.ca

Received and published: 27 February 2009

General comments:
By their very nature dissolved lipids are difficult to work with, consequently there are limited data for the marine environment. This manuscript describes the variability in a wide range of dissolved lipid classes in the context of an even wider range of supporting data. The authors have clearly made the most of the results from their comprehensive sampling program by providing an extensive discussion.

Specific comments:
What is cs-170?

What are the Lipid metabolites

zooplankton wax ester biomarkers

What about steryl esters?

Which are the biogenic lipids?

While phosphoglycerides is certainly a correct term, glycerophospholipids is more commonly used. Also are you sure all your phospholipids are indeed glycerol-based?

a major source of DOM, which is primarily composed of proteins, carbohydrates and lipids Is it really?

biomolecules, their resistance to remineralization and their transformation An interesting combination of properties.

a small proportion (<11%) of DOM is identifiable This seems to contradict the earlier DOM statement.

triglycerides The correct term is now triacylglycerols.

Dissolved lipids are operationally defined by GF/F 0.7 um membranes This is probably a bit too explicit as some authors use different cut-offs. In any case GF/F is a glass-fibre not a membrane filter. Why not just say filter?

Parrish et al., 1995). Not a good reference for this point; Liu et al. would be better.

90 samples A good data set.
Would it be useful to tabulate this information?

Give the diameter of the filters.

internal standard (hexadecan-3-one (?)) ... Did you use the same concentration each time? If so what was it? What was it dissolved in? Did you check for interferences in your sample types? None were found in samples from the northwest Atlantic (J. Chromatogr. 262:103) but some algae do synthesize ketones (Mar. Biol. 133:461).

steryl esters co-eluting with wax esters ... This is the only time you mention this: Is it enough? For almost the entire paper you call this band WE. Admittedly particulate lipids in the Atlantic usually contain much more WE than SE (Nature 286:798; J. Chromatogr. Sci. 39:146), but this is not always the case (Nature 286:798; Lipids 17:831). What do we know about dissolved wax versus steryl esters?

This is a very broad range of classes.

succession of wind gusts from opposite directions: SW, NE and SW occurred ... Over what periods of time?

Explain LSW and JD.

TLd concentrations varied from ... On what basis did you calculate molarity?

The day/night TLd profiles were not significantly different(?) ... Did you test this
statistically or do you mean there were no obvious or discernable differences?

I 14 . . . The only significant increase in DOC . . . Again do you mean this in a statistical sense?

p38

I 1,2 . . . and pigments), triacylglycerols, wax and steryl esters and metabolites . . .

You should probably list the metabolites here too.

I 4 . . . the glycolipids (monogalactosyl diacylglycerols) . . . What about DGDG and SQDG?

I 5 . . . pigments, monoacylglycerols and non-nitrogen containing phospholipids

I 26 . . . (normalized to a 150 m depth water column . . . Would it be more straightforward to calculate an average concentration based on integrated values?

p39

I 17 . . . results reflected the . . . The rest of the Results section is quite discursive.

p43

I 6 . . . bacterial production was significantly correlated . . . Did you measure bacterial production? Do you show these significant correlations?

I 25 . . . acids and alcohols (Gurr and James, 1980) . . . I am not sure what is being said here. In this context, I think Gurr and James talk mainly about lipases working fastest on triacylglycerols and slowest on monoacylglycerols.

p45

I 3 . . . hydrocarbon to depth . . . Perhaps you mean petroleum?

I 9 . . . the high HC proportion . . . Yes this is very high.

I 15 . . . in total carbon, most lipids being in the form of membrane phospholipids . . .
What about lipopolysaccharides?

I 27 . . . does not support the idea that these PL would represent the only BB increase. The phospholipid . . . BB?

p46

I 10 . . . shelter phospholipids . . . An interesting term.

p58

This table is already too complicated, but you could indicate the magnitude of the values that were not significant. Some people might be interested in the sign of a particular relationship, others might be interested in how strong or weak a relationship is, even if \( p > .05 \).

p62

Explain the dotted line.

p63

Should the symbols be different?

p64

Should the title be Total Lipids (% DOC)? I am not sure what the extrapolation statement means here or in Fig 7.

p68

What are the P values?

Technical corrections:
